

# The Impact of Medicaid Expansion in the Fort Peck Community

The Fort Peck Reservation is home to about 3,900 members of the Assiniboine and Sioux Tribes. The reservation, headquartered in Poplar, encompasses over two million acres in northeastern Montana spread across Roosevelt, Daniels, Valley, and Sheridan counties.<sup>i</sup>

Since Medicaid expansion was implemented in 2016, our Tribe has made progress toward improving the health and well-being of tribal members by enhancing the quality and availability of health care services.

The state of Montana has been a strong partner in this effort. Medicaid expansion creates a reliable source of revenue for the services we provide previously uninsured members, ensuring that we can build stable, successful healthcare programs. Montana created the Tribal Health Improvement Program, which has allowed us to reach, serve, and improve outcomes for some of our most medically complex members.

We appreciate that DPHHS is a strong and committed partner as we pursue shared goals of a healthier Tribe and State. Together, since the passage of the HELP Act in 2015, we have made a lot of progress, but there is more work to be done.

## Access to Health Care

**Approximately 1,390 American Indians in the Fort Peck community are enrolled in Medicaid expansion.**<sup>ii</sup> Members can access health care services through Fort Peck Tribal Health, the tribe's Health Promotion Disease Prevention program, and the Fort Peck Indian Health Service (IHS) Unit (which includes facilities in Poplar and Wolf Point) or at a provider of their choice.

Medicaid expansion is allowing us to make major improvements to our health care system:

- We assumed the federal government's management of dental, optometry, and audiology services. As a result, we have been able to hire dentists and offer a significant improvement in access to this critically important service.
- We are now offering mental health services to clients at our Spotted Bull Recovery Resource Center – a long-needed improvement for clients with dual diagnoses of both mental illness and substance use.
- We have built a new residential treatment center which we hope to begin offering services in 2025.

- The Medicaid Tribal Health Improvement Program has allowed us to provide case management services for 3,648 tribal members.

## Fort Peck Indian Health Service Unit

The local IHS facility has a five-level priority system for care. Historically, it operated at a Level 1, meaning they could only refer people with life or limb-threatening emergencies for care. Due to Medicaid expansion, they are currently operating at a Level 4. They can now offer or refer for additional services such as mammograms, colonoscopies, hip replacements, and other essential specialty consultations and surgical procedures.

**Referrals for care have increased by 112%.** This change affects all American Indians living on or near the Fort Peck Reservation, not only Medicaid recipients.

## Revenues to Support Better Health Care

Medicaid expansion has increased revenues for the Fort Peck Tribes and the Fort Peck IHS Service Unit. **Over the last two state fiscal years, these IHS and tribal health organizations have received an additional \$24.6 million in 100% federal reimbursement.** This increased revenue is the means to provide additional services to individuals within the Fort Peck Community. Having the ability to provide preventative care services within the community is making a difference in the lives of people. It supports the overall mission of a healthy membership while reducing the health disparity that exists in Montana.

## Access to Quality Health Care Services

In state fiscal year 2023 (July 2022 – June 2023), prior to the steep decline in coverage due to redetermination, in the Fort Peck Community, Medicaid expansion allowed for an estimated:<sup>iii</sup>

- 1,077 people to receive preventive services.
- 26 people to receive colonoscopies, with seven potential cases of colon cancer averted.
- 54 women to receive breast cancer screening.
- 30 people were newly diagnosed and treated for diabetes, which will prevent many costly complications such as kidney failure and dialysis in the future.
- 267 people to receive outpatient mental health services.
- 42 people to receive treatment for substance use disorders.

## Background: Health of American Indian People in Montana

American Indian people in Montana face serious barriers to receiving health care, including:

- The IHS budget amounts to \$4,078 per capita for American Indian people, compared with \$14,750 for the Veterans Health Administration and \$16,700 for Medicare.<sup>iv, v, vi</sup> This longstanding underfunding of health care for American Indian people makes it difficult or impossible for people to access medically necessary health care services.
- Health care for American Indian people living in urban areas is even more severely underfunded, accounting for less than 1% of the total IHS budget.<sup>vii</sup>
- Before Medicaid expansion, tribal members could not access most medical services except basic primary care and, in many cases, could not receive, for example, cancer screenings like mammograms and colonoscopies, consultation with specialists, surgeries such as hip replacements and gall bladder removals, and many others. This is because the IHS budget only allowed referrals for life-threatening emergencies, specifically *"emergent or acutely urgent care services that are necessary to prevent the immediate death or serious impairment of the health of the individual and if the diagnosis and treatment of injuries or medical conditions is left untreated, would result in uncertain but potential grave outcomes."*

American Indian people in Montana have substantially higher rates of illness and mortality than other Montana residents. For example:

- American Indian people in Montana die, on average, 17 years younger than other Montanans.<sup>viii</sup>
- The death rate for American Indian people in Montana is far higher than other Montanans for many common illnesses, including heart disease, cancer, injuries, and diabetes.<sup>ix</sup>
- American Indian people in Montana suffer high rates of mental distress and suicide; 26% of American Indian people in Montana report frequent mental distress compared with 18% of all Montana adults.<sup>x</sup> The suicide rate for American Indian people in Montana is estimated at 42 per 100,000, compared with a rate of 28 per 100,000 for all Montanans and 14.5 per 100,000 for U.S. residents overall.<sup>xi</sup>
